DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 06/28/2007 has been entered.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

1. Claim 1 is rejected under 35 U.S.C. 102(e) as being anticipated by McEfresh et al. (US 6843552).

McElfresh et al. discloses a printhead assembly, comprising:

at least one printhead module comprising at least two printhead integrated circuits (FIG. 2), each of which has nozzles (FIG. 2, element 42) formed therein for delivering printing fluid onto the surface of print media, a support member supporting and carrying the printing fluid for the at least two printhead integrated circuits (FIG. 3), and an electrical connector for connecting electrical signals to the at least two printhead integrated circuits (FIG. 5, elements 68, 68'); and

Page 3

a plurality of longitudinally extending electrical conductors (*FIG. 5, elements 74, 74'*) providing power to the at least two printhead integrated circuits, being arranged as first and second groups of electrical conductors (*FIG. 5: The first group is element 74. The second group is element 74'*), the first group connected to a first power supply and extending from a first end of the printhead assembly to a region intermediate the ends of the printhead assembly, and the second group connected to a second power supply and extending from the second end to connect to the first group at the region intermediate the first and second ends of the printhead assembly to supply power in parallel from both ends of the printhead assembly (*FIG. 5*).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Silverbrook et al. (US 6612240) in view of McEfresh et al. (US 6843552).

Silverbrook et al. ('240) discloses a printhead assembly (FIG. 14: Each printhead assembly comprises a PCB (108 or 110) and a printhead module including elements 104.1 and 106.1 (or 104.2 and 106.2)), comprising:

at least one printhead module comprising at least two printhead integrated circuits (FIG. 14: One printhead module comprising two printhead integrated circuits 106.1 and 104.1), each of which has nozzles formed therein for delivering printing fluid onto the surface of print media (column 6, lines 22-30), a support member supporting and carrying the printing fluid for

Art Unit: 2853

the at least two printhead integrated circuits (FIG. 14, element 120: The fluid carrier 120 carries fluid along the length of the printheads), and an electrical connector for connecting electrical signals to the at least two printhead integrated circuits (FIG. 14: Conductors 116 connects the printheads to the PCB 108 or 110); and

Page 4

a plurality of longitudinally extending electrical conductors for providing power to the at least two printhead integrated circuits (FIG. 14, elements 124 and 122), being arranged as first and second groups of electrical conductors, the first group extending from one end of the printhead assembly to a region intermediate the ends of the printhead assembly (FIG. 14: The first electrical conductors are the cable 122 extending from the connector 124 (located at the left end of the assembly) to the connector located at the intermediate region of the assembly), and the second group extending from the other end to connect to the first group at the region intermediate the ends of the printhead assembly (FIG. 14: The second electrical conductors are the cable 122 extending from the connector located at the intermediate connector to the connector located at the right end of the assembly).

Silverbrook et al. ('240), however, does not teach wherein the first and second groups of electrical conductors are connected to a first and second power supplies, respectively, to supply power in parallel from both ends of the printhead assembly.

McEfresh et al. discloses an ink jet head assembly comprising a plurality of printhead integrated circuits (*FIG. 5*) and first and second groups of electrical conductors (*FIG. 5*, elements 74, 74'), wherein the first and second groups of electrical conductors are connected to a first and second power supplies, respectively, to supply power in parallel from both ends of the printhead assembly (FIG. 5).

Application/Control Number: 10/760,189

Art Unit: 2853

Therefore, it would have been obvious for one having ordinary skill in the art at the time the invention was made to modify Silverbrook's printhead assembly to provide power from two ends of the printhead assembly to the printhead integrated circuits as disclosed by McEfresh et al. The motivation for doing so would have been to provide power in parallel from both ends of the printhead assembly to the printhead integrated circuits as taught by McEfresh et al. (FIG. 5).

• Silverbrook et al. ('240) also discloses the following claimed invention:

Regarding to claim 2: further comprising a casing in which the at least one printhead module and the plurality of electrical conductors are removably mounted (*FIG. 9, element 56*).

Regarding to claim 3: further comprising drive electronics incorporating at least one controller (FIG. 14, elements 126) for controlling the printing operation of at least one of the at least two printhead integrated circuits via the electrical connector (FIG. 14, elements 116), wherein power is provided to the drive electronics by the electrical conductors via the electrical connector.

Regarding to claim 4: wherein the first group of electrical conductors and the second group of electrical conductors overlap each other in the intermediate the ends of the printhead assembly (*FIG. 14, element 122*).

Regarding to claim 5: wherein the at least one printhead module is formed as a unitary arrangement of the at least two printhead integrated circuits, the support member, the electrical connector, and at least one fluid distribution member mounting the at least two printhead integrated circuits to the support member; and the support member has at least one longitudinally extending channel for carrying the printing fluid for the printhead integrated circuits and includes a plurality of apertures extending through a wall of the support member arranged so as to direct

Art Unit: 2853

the printing fluid from the at least one channel to associated nozzles in both, or if more than two, all of the printhead integrated circuits by way of respective ones of the fluid distribution members (FIG. 11, element 136).

Response to Arguments

Applicant's arguments with respect to claim 1 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to LAM S. NGUYEN whose telephone number is (571)272-2151. The examiner can normally be reached on 7:00AM - 3:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, STEPHEN D. MEIER can be reached on (571)272-2149. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
